Active matter: interacting self-propelled particles

A. Walther and A. H. E. Müller, *Soft Matter* **4**, 663 (2008)

## Light-induced clusters of colloids

J. Palacci *et al.*, Science **339**, 936 (2013)

Many-body dynamics

$$0 = -\nabla_i U - \frac{dx_i}{dt} + v_i$$

Nonequilibrium self-propulsion  $v_i$

$$\langle v_i(t) v_j(0) \rangle \equiv T \delta_{ij} \frac{e^{-|t|/\tau}}{\tau}$$

Persistence time  $\tau$

Equilibrium  $\tau \rightarrow 0$

M. E. Cates and J. Tailleur,  
Ann. Rev. CMP **6**, 2119 (2015)

## Interacting repulsive particles

ÉF *et al.*, Phys. Rev. Lett. **117**, 038103 (2016)

## Main questions of interest

- Phase diagram: equilibrium mapping

J. Tailleur *et al.*, Phys. Rev. Lett. **100**, 218103 (2008)

- Equation of state: pressure vs. density

A. P. Solon *et al.*, Phys. Rev. Lett. **114**, 198301 (2015)

How far from equilibrium is active matter?

Comparing forward and backward dynamics

$$\mathcal{S} \equiv \lim_{t \rightarrow \infty} \frac{1}{t} \ln \frac{\mathcal{P}}{\mathcal{P}^R}$$

Entropy production rate

Equilibrium limit  $\mathcal{S} \underset{\tau=0}{=} 0$

Self-propelled particles

$$\mathcal{S} = \frac{\tau^2}{2T} \left\langle \left( \frac{dx_i}{dt} \nabla_i \right)^3 U \right\rangle$$

Perturbative treatment in  $Pe \equiv \sqrt{\frac{\text{persistence time}}{\text{relaxation time}}}$

- $P_S \sim e^{-U/T} [1 + \mathcal{O}(Pe^2)]$

- $\left\langle \left( \frac{dx_i}{dt} \nabla_i \right)^3 U \right\rangle = \mathcal{O}(Pe^3)$

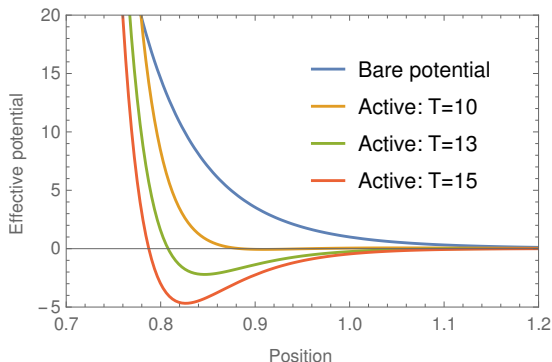

Effective equilibrium regime  $\left\{ \begin{array}{l} \text{Non-Boltzmann statistics} \\ \text{Time reversal symmetry} \end{array} \right.$

# Interacting active particles

## Effective potential

$$U_{\text{eff}} \equiv U + \tau \left[ \frac{(\nabla_i U)^2}{2} - T \nabla_i^2 U \right]$$

## Original pair-wise potential

$$U \equiv \frac{1}{2} \sum_{\{i,j\}=1}^N V(r_i - r_j)$$

$$V \sim \frac{1}{x^{12}}$$

# Interacting active particles

External perturbation  $f_i(t)$

$$\langle \delta x_i(t) \rangle \equiv \int_0^t R(t-s) f_i(s) ds \rightarrow \text{Response function } R(t)$$

Fluctuation-dissipation relation

$$R(t) \underset{\tau=0}{=} -\frac{1}{T} \frac{d}{dt} \langle x_i(t) x_i(0) \rangle$$

$$R(t) = -\frac{1}{T} \frac{d}{dt} \left\langle x_i(t) x_i(0) + \tau^2 \frac{dx_i(t)}{dt} \frac{dx_i(0)}{dt} \right\rangle$$

Probing effective equilibrium regime

# Interacting active particles

Numerical simulations: 3 values of  $T$

Susceptibility

$$\chi(t) \equiv \frac{1}{N} \int_0^t R(t-s) ds$$

Correlation

$$C_{\text{eff}}(t) \equiv \frac{1}{N} \left\langle x_i^2(t) + \tau^2 \left[ \frac{dx_i(t)}{dt} \right]^2 \right\rangle \\ - \frac{1}{N} \left\langle x_i(t)x_i(0) + \tau^2 \frac{dx_i(t)}{dt} \frac{dx_i(0)}{dt} \right\rangle$$

## Nonequilibrium properties of active systems

- Interacting active particles

Effective equilibrium regime

- Coarse-grained dynamics

Spatial structure of nonequilibrium
